

Load balancing router

ICT provider, Pinnacle Micro has announced the immediate availability of a 4-port load balancing router from D-Link. The DI-LB604 has been designed for small businesses offering a cost effective and reliable network solution. Featuring dual WAN ports and four LAN ports, the router provides consistent network uptime and reliable Ethernet connectivity.

The built-in four-port switch provides computers on the LAN with network connectivity and Internet access. Companies can connect up to four PCs or other networking devices to access company resources and use the Internet and the DI-LB604 is scalable, allowing users to add switches as the business grows or network needs expand. The DI-LB604 features the dual Stateful Packet Inspection (SPI) and Network Address Translation (NAT) firewall with denial of service (DoS) attack protection to safeguard the network. This helps keep the network reliable and secure while maximising the productivity of the network clients.
